

Climate Change Advisory Council Secretariat

CB WG Meeting 5

27th July 2023

CLIMATE CHANGE ADVISORY COUNCIL

Agenda

- Time Agenda Item
- **13:30** 1. Opening of Meeting
- **13:35** 2. Focused discussion on Methane
- **14:40** 3. Ethics of Methane Emissions and Climate Change
- **15:15** 4. Scoping of Modelling Work
- **16:00** 5. Carbon Budgets Work Plan
- **16:25** 6. Next Steps and Agenda for next meeting
- **16:30** 7. AOB
- 16:30 Meeting Close

1. Opening of Meeting

Action Number	Date Raised	Description	Owner	Due	Status
3	20/04/23	Expand discussion of macroeconomic inputs/ drivers	CCAC Secretariat and relevant CB WG Members	Q3 2023	Ongoing – Update to be provided at CB WG Meeting 4
5	20/04/23	Further develop the approach and preparation for topical discussions	CCAC Secretariat	Q3 2023	Ongoing – Secretariat to provide an update on the approach and preparation for upcoming topical discussions at each meeting.

Agenda

- **13:30** 1. Opening of Meeting
- **13:35** 2. Focused discussion on Methane
- **14:40** 3. Ethics of Methane Emissions and Climate Change
- **15:15** 4. Scoping of Modelling Work
- **16:00** 5. Carbon Budgets Work Plan
- **16:25** 6. Next Steps and Agenda for next meeting
- **16:30** 7. AOB
- 16:30 Meeting Close

Agenda

- Time Agenda Item
- **13:30** 1. Opening of Meeting
- **13:35** 2. Focused discussion on Methane
- **14:40** 3. Ethics of Methane Emissions and Climate Change
- **15:15** 4. Scoping of Modelling Work
- 16:00 5. Carbon Budgets Work Plan
- **16:25** 6. Next Steps and Agenda for next meeting
- **16:30** 7. AOB
- **16:30** Meeting Close

2. Scoping of Modelling Work

Scoping the potential for additional modelling and testing of results by;

- 1. FERs Ltd modelling key parameters for Ireland's forestry matrix, and
- 2. NTA Framework Regional Modelling System modelling key aspects of the transport sector.
 - Model Overview
 - Key questions to ask the model
 - Model Inputs (assumptions / variables / constraints)
 - Model Outputs
 - Sensitivities

Agenda

- Time Agenda Item
- **13:30** 1. Opening of Meeting
- **13:35** 2. Focused discussion on Methane
- **14:40** 3. Ethics of Methane Emissions and Climate Change
- **15:15** 4. Scoping of Modelling Work
- 16:00 5. Carbon Budgets Work Plan
- **16:25** 6. Next Steps and Agenda for next meeting
- **16:30** 7. AOB
- **16:30** Meeting Close

5. Carbon Budgets Work Plan: Topics for Meetings

CB WG Meeting No.	Proposed Date and Time	Topic(s) for Consideration
	1 Thursday 9 th March 2023 10:00 – 13:00	Carbon Budgets Methodology
	2Thursday 20 th April 2023 13:30 – 16:30	Carbon Budgets Methodology / Scoping of modelling work
	3Wednesday 31st May 2023 10:30 – 13:30	Vision for 2050 and Beyond/ Scoping of modelling work/
	4Thursday 29th June 2023 13:30 – 16:30	Climate Justice and 'Paris Test'/ Scoping of modelling work/ Macroeconomic Impacts of carbon budgets/
	5Thursday 27 th July 2023 13:30 – 16:30	Focused discussion on methane/ Scoping of modelling work/
	6Friday 8 th September 2023 13:30 – 16:30	Populations Projections/ Socioeconomic considerations
CB WG Workshop 1	Wednesday 13th September 2023 13:30 – 16:30	Input model parameters for 2030 starting points, scenario development and assumptions
	7Thursday 19 th October 2023 13:30 – 16:30	Landuse Review (TBC)/ Biodiversity Considerations/ 2024 Projections Process (EPA, SEAI & ESRI)
	8Thursday 23 rd November 2023 10:30 – 13:30	Role of Negative Emissions/ International approaches to carbon budgets
	9Friday 15 th December 2023 13:30 – 16:30	COP28 – Global Stocktake (TBC)/ ESAB 2040 Target (TBC)

5. Carbon Budgets Work Plan: Meeting No. 6: 8th Sept. 13:30 – 16:30

1. Socioeconomic Considerations (NESC)

- Overview of the NESC report on exploring a Just Transition on Agriculture and Land use
- Discussion of the Act requirement to take account of "a just transition to a climate neutral economy which endeavours, in so far as is practicable, to maximise employment opportunities, and support persons and communities that may be negatively affected by the transition" and approach for the second programme

2. Populations Projections

- CSO (Cathal Doherty) to present on their population projections process
- ESRI (Adele Bergin) to present on their plans for the next round of modelling feeding into the National Planning Framework Review
- DHLGH (Alma Walsh and Colin Fulcher) to present on the National Planning Framework Review

5. Carbon Budgets Work Plan: Workshop 13th September 13:30 – 16:30

Proposed Agenda

1. Building Blocks for scenarios for CB3 and CB4

- 2030 starting points: staying within carbon budget 1 and 2, underperformance (EPA WAM), overperformance (sensitivity)
- Targets for 2050: based on an emissions trajectory consistent with specific temperature outcomes and based on an emissions trajectory towards net zero greenhouse gas emissions in 2050
- Considering the ESAB recommendation for an EU 2040 climate target

2. Scenario development for 2nd Carbon Budget Programme

- Shared understandings to inform scenario development by Teagasc (FAPRI), NUIG (GOBLIN), UCC (TIM) and SEAI (NEMF)
- Discussion of potential for integration and discrepancies
- Anticipated outcomes

3. Competing Land Use Requirements

- Land use and model representations of biodiversity constraints
- Afforestation, Biomethane, Nitrogen demand (water quality/air quality)
- 4. Timeline for Modelling/ Analysis Iteration 1

Objective: Develop a shared understanding of model inputs and expected outputs

Post Workshop

- Secretariat to prepare an outcome report for CCAC meeting on 28th Sept.
- Modelling/Analysis
 Iteration 1 Commences
 following CB WG
 meeting No. 7 19th Oct.

Agenda

Time Agenda Item 13:30 1. Opening of Meeting 13:35 2. Scoping of Modelling Work 14:15 3. Macroeconomic Impacts of carbon budgets

- **15:00** 4. Climate Justice and 'Paris Test'
- 16:15 5. Carbon Budgets Work Plan
- **16:25** 6. Next Steps and Agenda for next meeting
- **16:30** 7. AOB
- **16:30** Meeting Close

AOB?

Irish Carbon Budgets: Methane

Kian Mintz-Woo

University College Cork (Ireland) / International Institute for Applied Systems Analysis (Austria)

July 27, 2023

- Philosophers tell us that we need to be wary of arguments that advance our own interests in uncertain contexts, since the dearth of theory might lead us towards "moral corruption" (Gardiner, 2010, 10.1093/oso/9780195399622.003.0012)
- Carbon budgets depend on "irreducibly normative" assumptions (Dooley et al., 2021, 10.1038/s41558-021-01015-8; Schulen et al., 2023, 10.1002/wcc.847)
- Permissions to emit are not themselves morally important—they only allow us to access morally important things (capabilities/welfare)

OUTLINE

- 1. The stock/flow accounting problem
- 2. Three responses
- 3. Conclusion and further resources

INTRODUCTION	STOCK/FLOW ACCOUNTING	THREE OPTIONS	Conclusion
000		000	00

THE PROBLEM

- Carbon dioxide (CO₂) is a stock pollutant: warming potential is (basically) insensitive to the timing of emissions, just to the entire long-lived stock of carbon (physical accident)
- Methane (CH₄) is a flow pollutant: warming potential is highly sensitive to the timing of emissions, since it decays more rapidly
- ► The Stock/Flow Accounting Problem is: how or should CO₂ and CH₄ be compared?
- Context: In most countries, less material than in Ireland
- Despite the fact that this is not discussed in the philosophical literature, we can tackle it in the same argument-/justification-based way

FIRST: ALLOW SUBSTITUTION USING GWP-100

- Standard accounting practices allow for comparison with CO₂ using GWP-100 (i.e. global warming potential over a hundred year period)
 - Pro: This is standard practice, both across the IPCC and across most peer countries (e.g. EU countries, stocktaking comparisons)
 - Pro: Very straightforward, both for modelling (e.g. 2030 and 2050 targets) and for various stakeholders (e.g. public or decision-makers)
 - Con: Highly sensitive to the period (100 years is an arbitrary temporal timeline and much greater with smaller timelines)
 - Con: Subject to some conversion factor updates

SECOND: ALLOW SUBSTITUTION USING GWP*

- Newer research, especially from Myles Allen, allows for comparison with CO₂ using GWP* (i.e. global warming potential given constant emission flows)
 - Pro: This more accurately connects CH₄ with actual warming effects (e.g. avoids long-term warming associated with increasing stocks while reducing flows)
 - Pro: [EPA] Can be implemented with the CCAC Paris Test (as has been shown by Paul Price and others)
 - Con: Very complex to explain to a variety of stakeholders (sectoral, public, decision-makers); highly unintuitive
 - Con: Could grandfather in previous high methane flows; potentially unfair

THIRD: SPLIT-GAS ACCOUNTING

- Some countries have separate budgets (and/or targets) for CO₂ and CO₄ (e.g. New Zealand)
 - Pro: This avoids having to determine conversion factors—reduces types of value judgement
 - Pro: Very straightforward to explain to stakeholders (easier to avoid double-(ac)counting tricks)
 - Con: Requires a parallel debate to CO₂—doubles the existing types of value judgment
 - Con: [EPA] Given that our brief is to give a carbon budget (one?) to CCAC, this would require (at least two) budgets and then potentially combining them

TAKEAWAYS

- My personal view is that split-gas accounting is more justifiable, since it reduces the type of value judgments
- One focal point is PA reductions in CH₄ (on an EPC basis). Note that this is still very conservative, in the sense that it effectively grandfathers Ireland's historically high CH₄ emissions

A COUPLE RESOURCES

- For discussions about philosophical equity principles (or burden-sharing principles): Polluter Pays, Beneficiary Pays, Ability to Pay, Polluter Pays, Then Receives, see my attached (Mintz-Woo, 2023);
- 2. For details on philosophical approaches to population ethics, cf. Cafaro (2012, doi:10.1002/wcc.153; 2022; doi:10.1002/wcc.748) [All citations are hyperlinks]

Methane policy targets

Joe Wheatley

CBWG 27 July 2023

"The [Long Term] Strategy is consistent with achieving net zero emissions for long-lived greenhouse gases (CO2 and N2O) and a significant reduction in methane emissions by 2050, thus establishing a climate neutral economy."-DECC 2023

Advantages of Simple Climate Models

- Central tool for IPCC global policy analysis since TAR (2001, MAGICC)
- Rich information compared to metrics
- Simple, fast, intuitive
- Calibrated to latest ESM outputs CMIP6
- National-level contributions to climate change
- Uncertainty analysis
- Multi-model approach

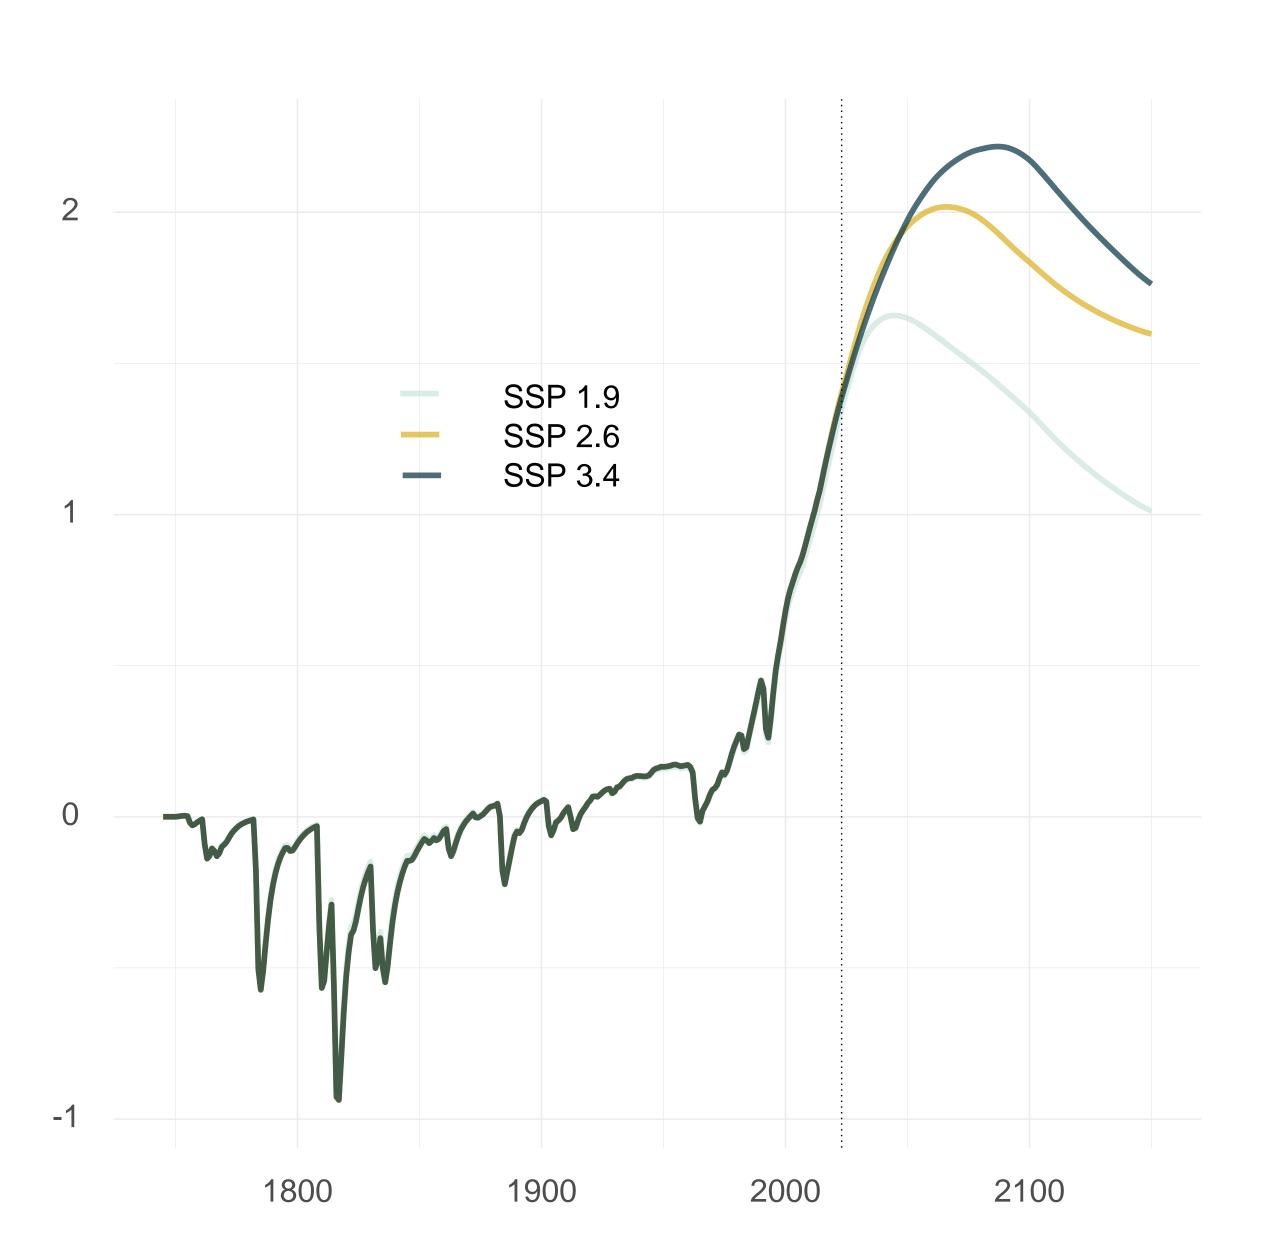

MAGICC, FaIR, Hector, Oscar,...

Alternative frameworks

- Temperature
- Carbon Neutrality
- Net Zero
- Temperature Neutrality
- Climate Neutrality

Alternative frameworks

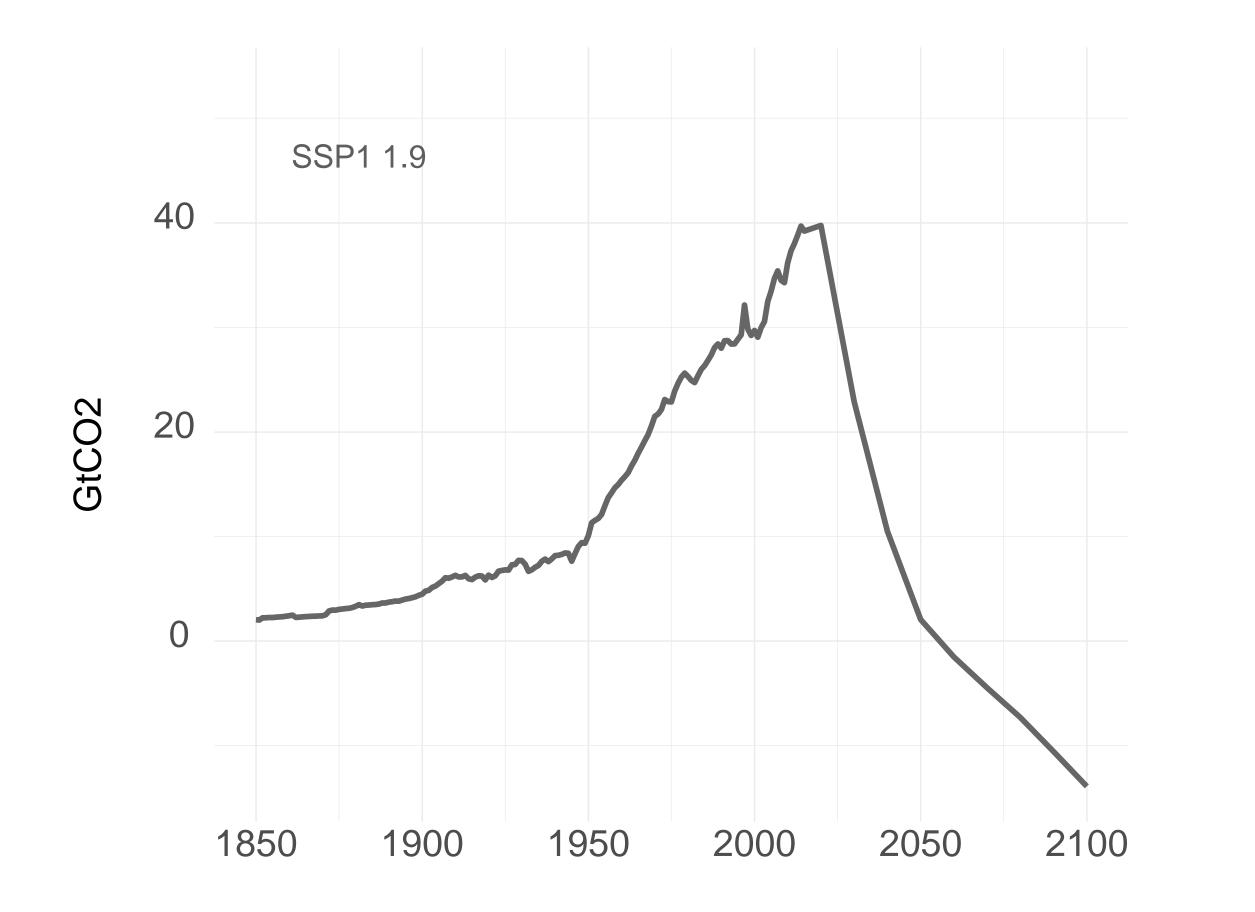

- Temperature e.g. Paris Article 2.1(a)
- Carbon Neutrality
- Net Zero
- Temperature Neutrality
- Climate Neutrality

Hectorv3.1

Alternative frameworks

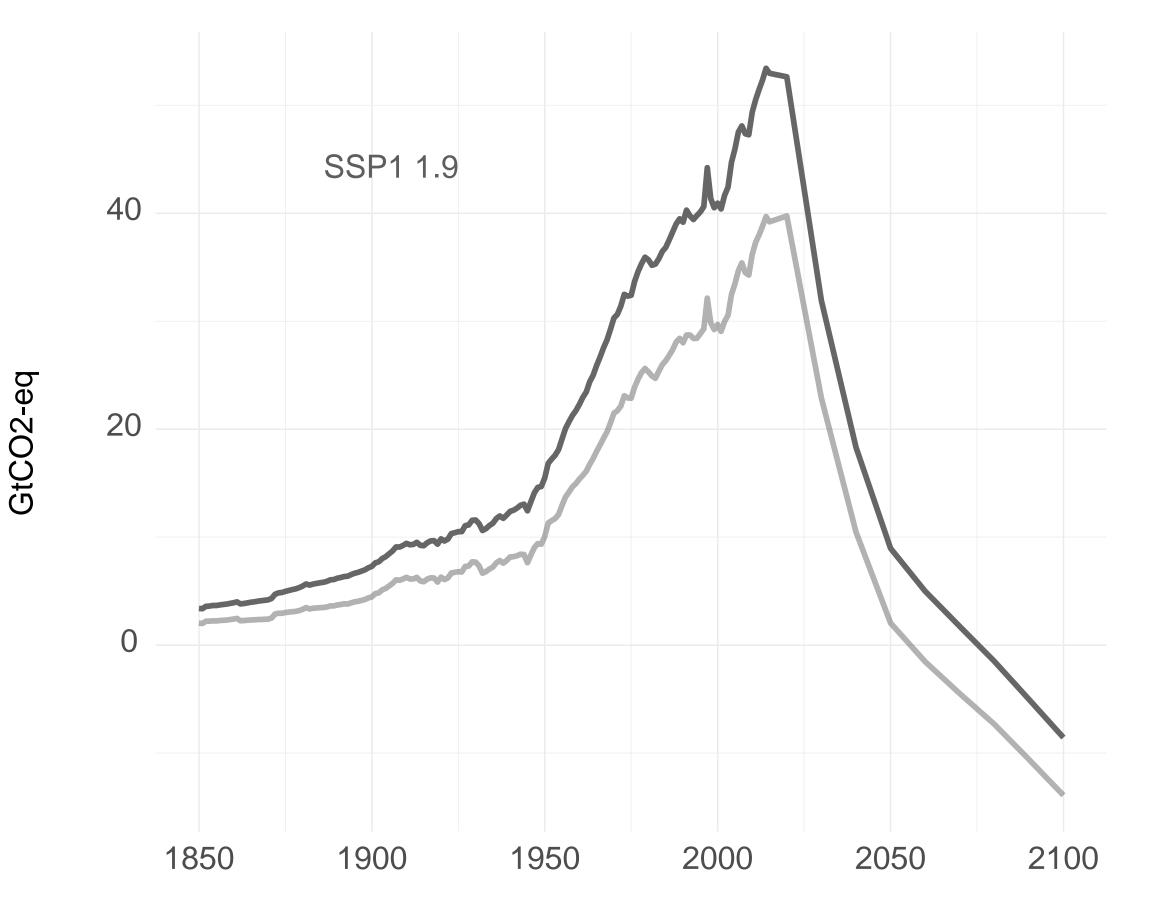

- Temperature
- Carbon Neutrality e.g. 2056 in SSP1.9
- Net Zero
- Temperature Neutrality
- Climate Neutrality

Alternative frameworks

- Temperature
- **Carbon Neutrality**
- GWP100 Net Zero e.g. 2075 in SSP1.9
- Temperature Neutrality
- Climate Neutrality

"achieve a balance between anthropogenic emissions by sources and removals by sinks of greenhouse gases in the second half of this century" - Paris Article 4.1

AR5 GWPs

Alternative frameworks

- Temperature
- Carbon Neutrality
- Net Zero
- Temperature Neutrality
- Climate Neutrality

scenario	TN year	°C
SSP 1.9	2045	1.66
SSP 2.6	2066	2.02
SSP 3.4	2087	2.22

Hectorv3.1

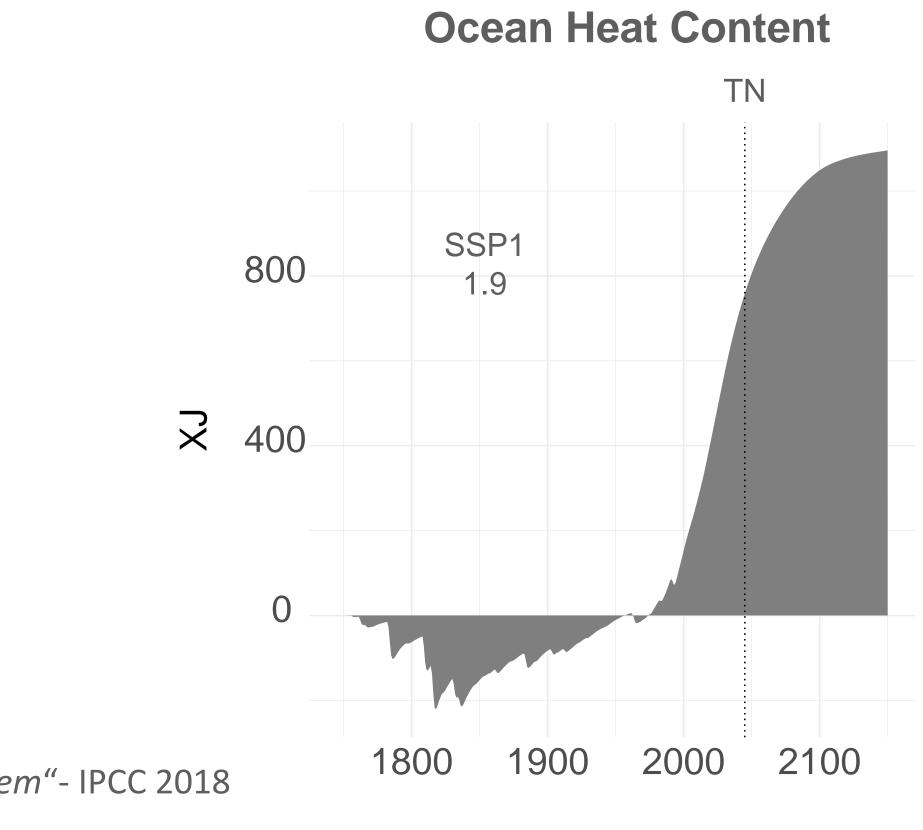

Alternative frameworks

- Temperature
- Carbon Neutrality
- Net Zero
- Temperature Neutrality
- Climate Neutrality (Climate Laws)

"A state in which human activities result in no net effect on the climate system"- IPCC 2018

"Reaching climate neutrality will mean that Ireland will have no further negative impacts on the *climate system by mid-century."* Long Term Strategy 2023

"Climate neutrality is considered to mean a cessation of further warming of the Earth's climate system by atmospheric greenhouse gases."- Climate Neutrality Forum 2021

Hectorv3.1

National contribution to warming in SCM

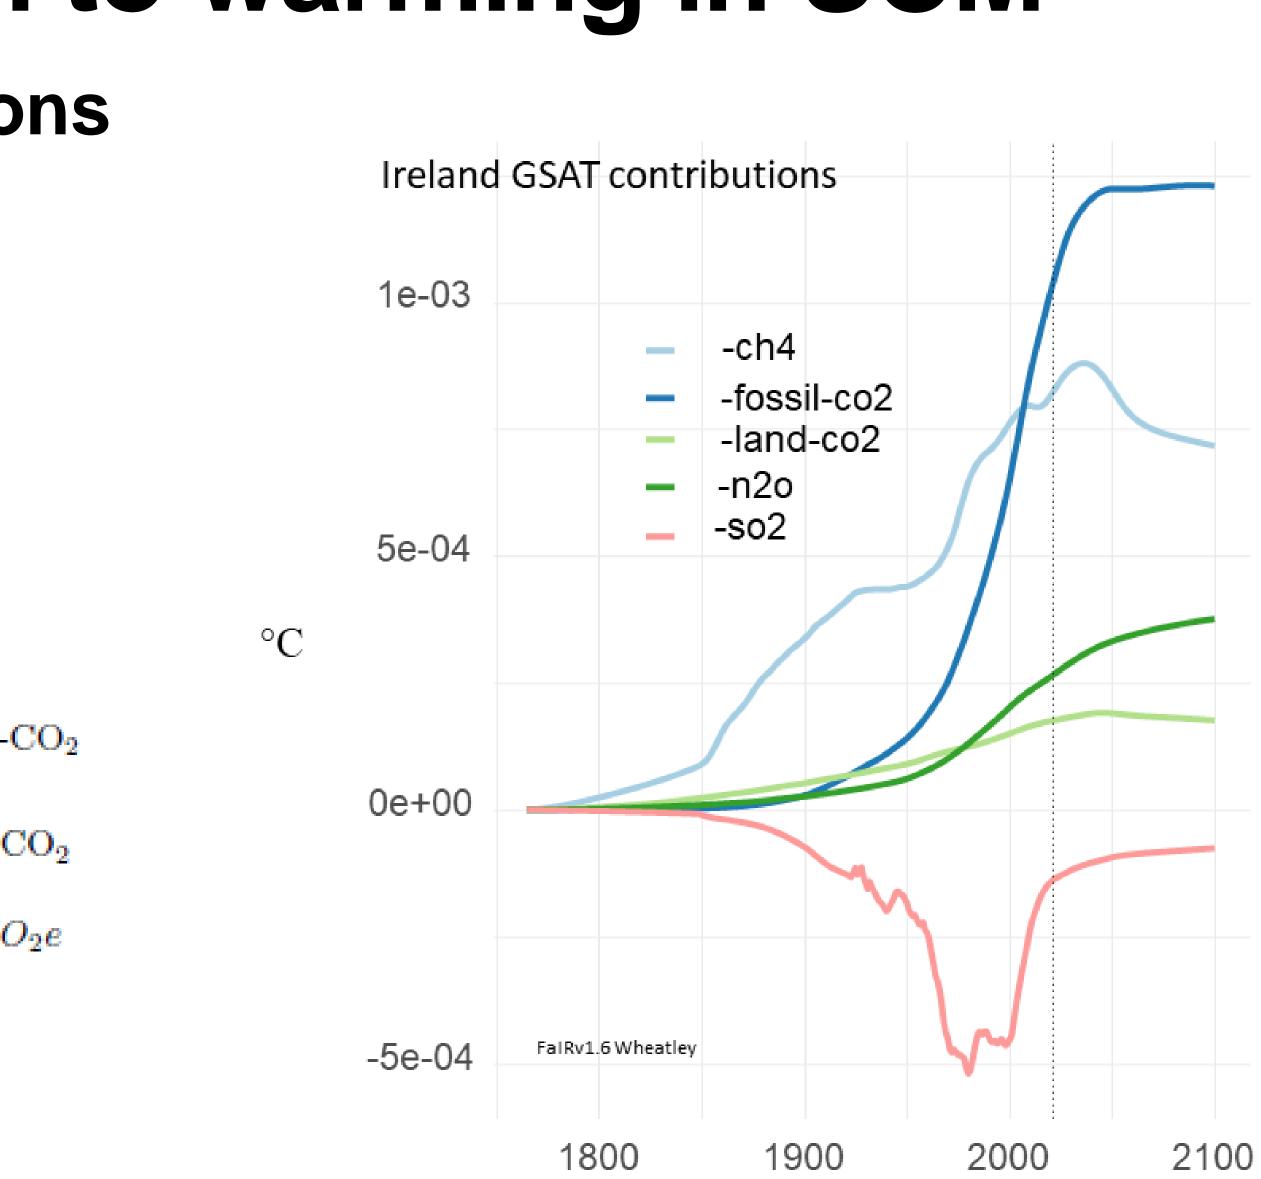

exclude Irish territorial emissions

- Historical climate forcers https://zenodo.org/record/7004406#.ZHR-2HbMK3A
- Future scenarios e.g.

			IE-C		
gas	2100	2050	2035	2030	2025
fossil-	-7	0	35	49	85
CH_4	50	60	85	90	95
N_2O	50	60	85	90	95
land-(-20	-10	80	85	95
SO_2	0	0	35	49	85
MtC0	8.0	13.6	37.4	44.3	60.1

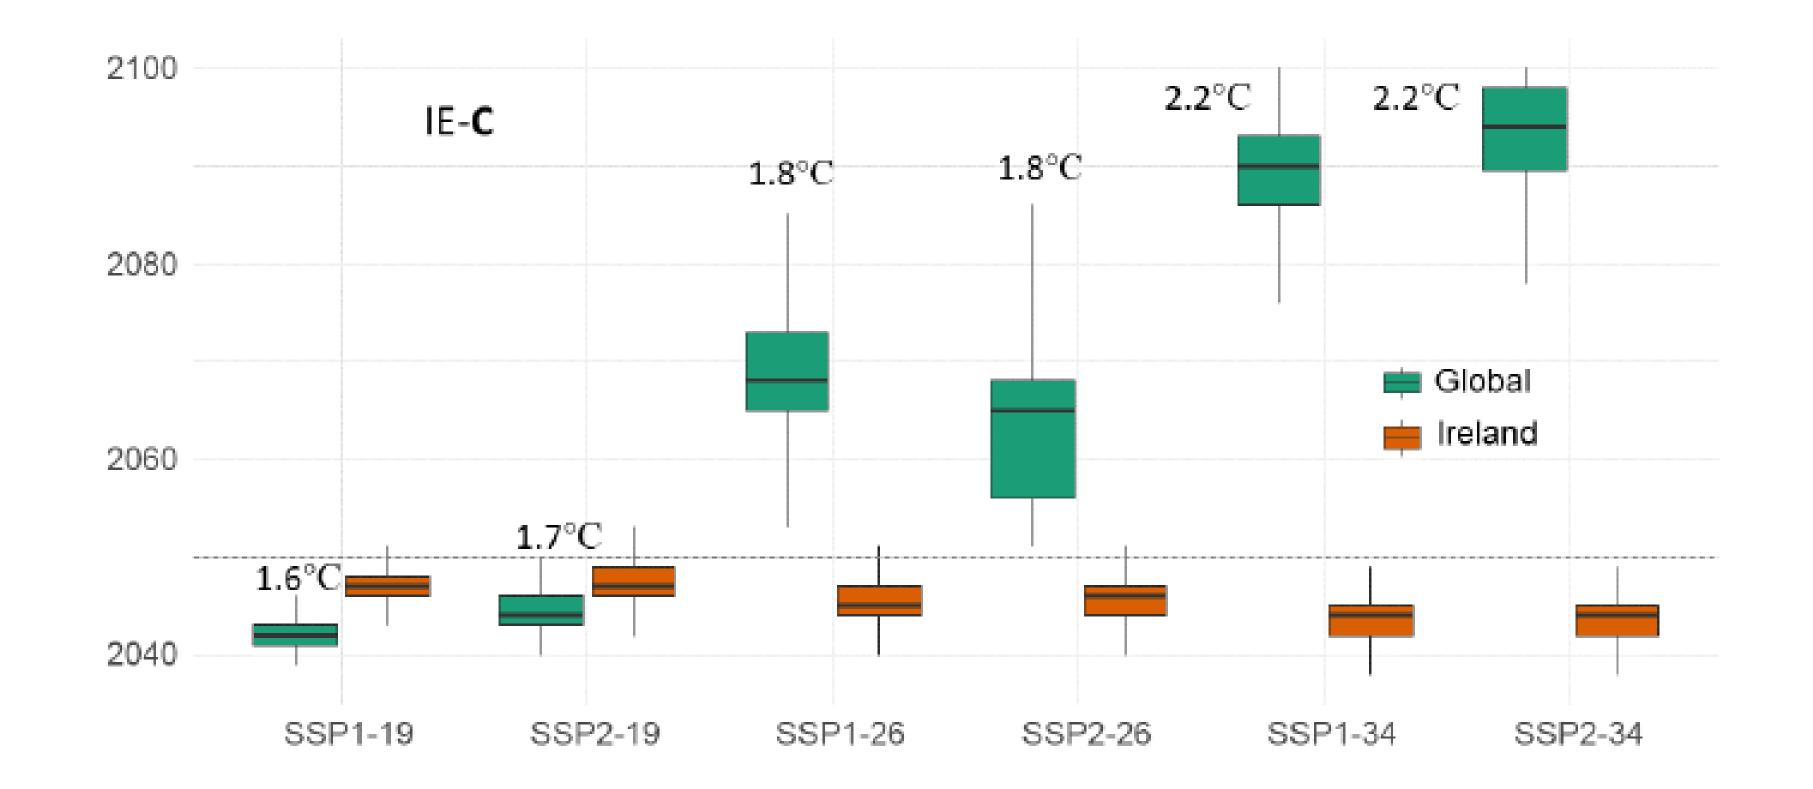

Emissions as % of 2018

Gutschow, J., Gunther, A., & Pfluger, M. (2021). The **PRIMAP-HIST** national historical emissions time series (1750-2019) v2. 3.1.

National vs Global Temperature Neutral Year

Ireland scenario: carbon neutral in 2050, methane -40%

FalRv1.6 1000-member ensemble

Methane impact depends on future atmosphere Radiative forcing and lifetime

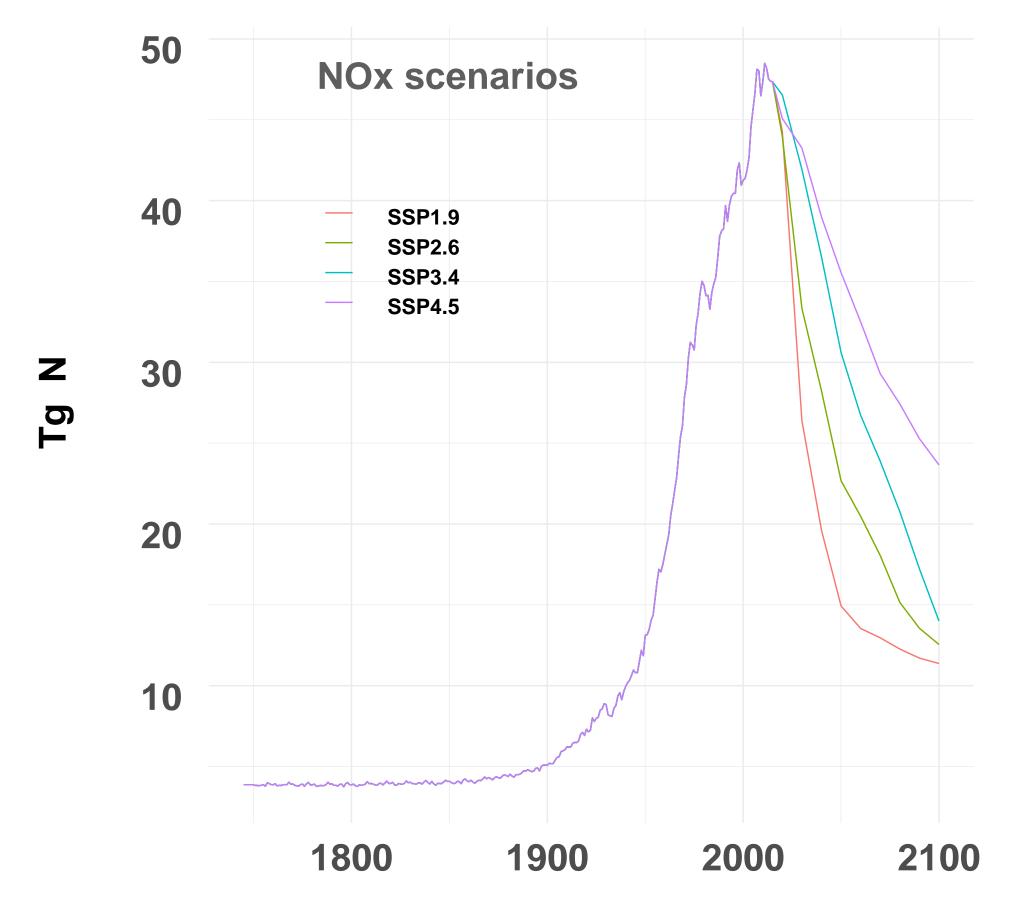

$$RF_{CH_4} \propto \sqrt{M} - \sqrt{M_0}$$

M methane concentration (~1900 ppb)

*N*₂*O* absorption band overlaps

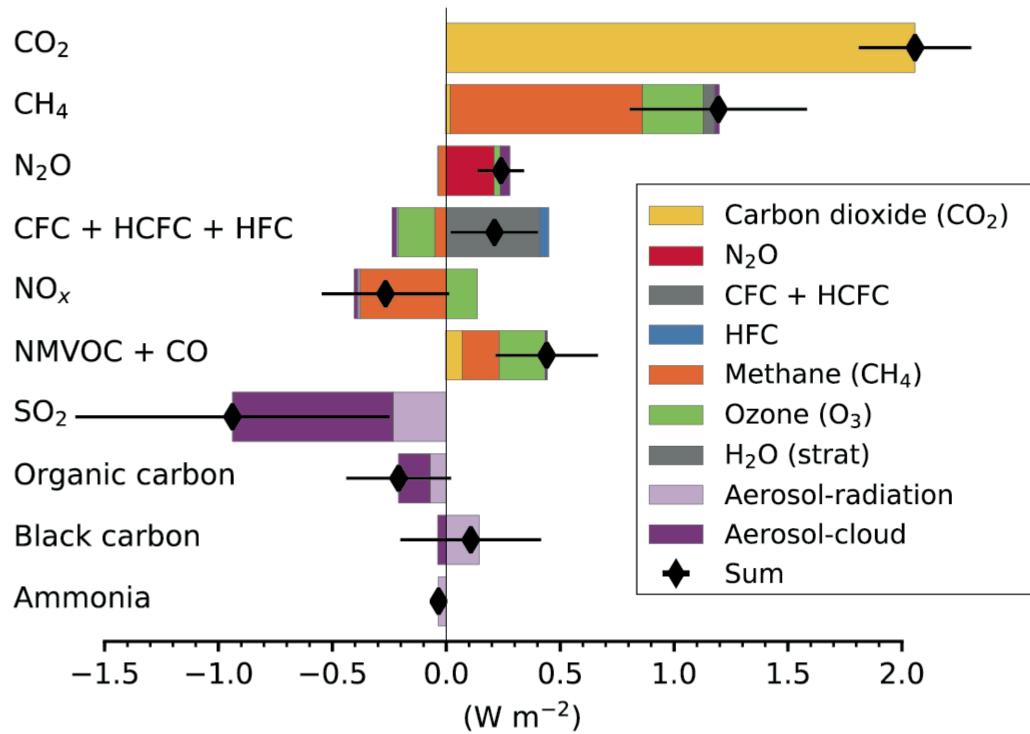

$$\tau_{CH_4}^{-1} \propto [OH]$$

NOx: [OH] \uparrow NMVOC: [OH] \downarrow CO: [OH] \downarrow

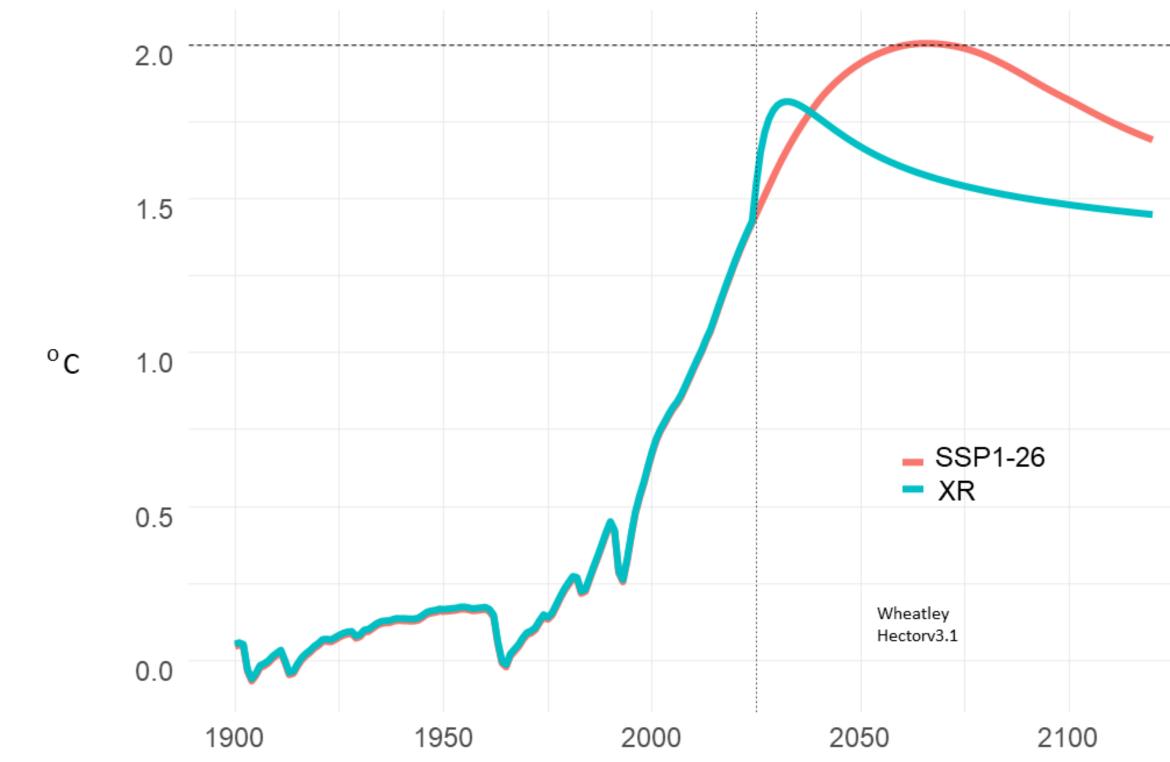

Short-lived air pollutants Relevant for temperature neutrality

(a) Effective radiative forcing, 1750 to 2019

IPCC_AR6_WGI_Figure_6_12

2025 termination shock

Conclusions

- SCMs: useful tools for national policy analysis
- Split-gas approach needed to assess warming impacts
- Methane warming reflects future atmospheric CH4 concentration, NOx ...
- Temperature neutrality in 2040s consistent with 1.5°C target

Allen, M. R., Peters, G. P., Shine, K. P., Azar, C., Balcombe, P., Boucher, O., . . . others (2022). Indicate separate contributions of long-lived and short-lived greenhouse gases in emission targets. npj Climate and Atmospheric Science, 5 (1), 1{4

Regional Modelling System (RMS) CCAC Carbon Budgets Working Group

Peadar Ó Súilleabháin and Karen Whitaker on behalf of Barry Colleary

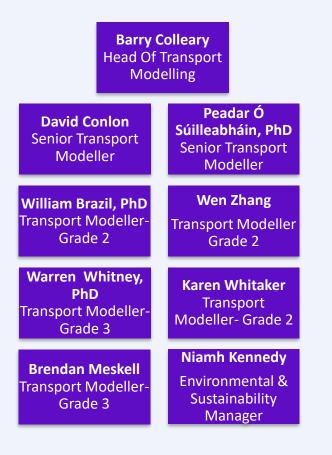

- 1. Model Overview
- 2. Key questions to ask the model
- Model Inputs (assumptions/variables/constraints)
- 4. Model Outputs
- 5. Sensitivities

27th July 2023

NTA Transport Modelling Division The Team

Experience and Expertise

- Estimating and Forecasting Transport Demand using forecasts from Planning (CSO)
- Multi-Modal Model Development
- Survey design & Statistical analysis
 - National Household Travel Surveys
- Data Collection, Analysis and GIS mapping
- Multi-Modal Scheme Appraisal (PAG Stages 1-4)
- Preparation of EIAs
- Assisting Preparation of Transport Assessments
- Economic Appraisal & Business Case Preparation
- Local Area Models + Micro-Simulation
- All details in between

Introduction What is the Transport Modelling Suite?

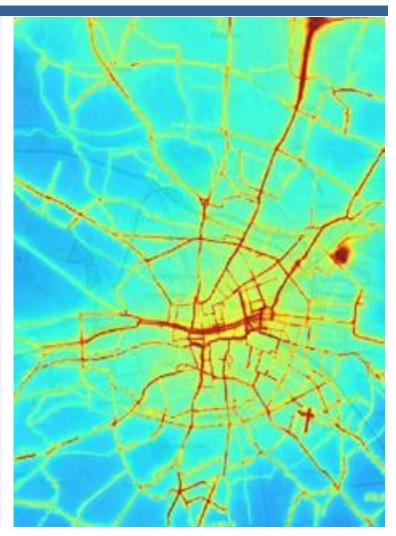

Overview

A suite of computer models to mimic our transport systems, networks and behaviours

Developed to support strategic planning and project appraisal

Includes the RMS and stand-alone processing tools

Used to **inform policy** and answer important **transport questions**

Introduction RMS Application Examples

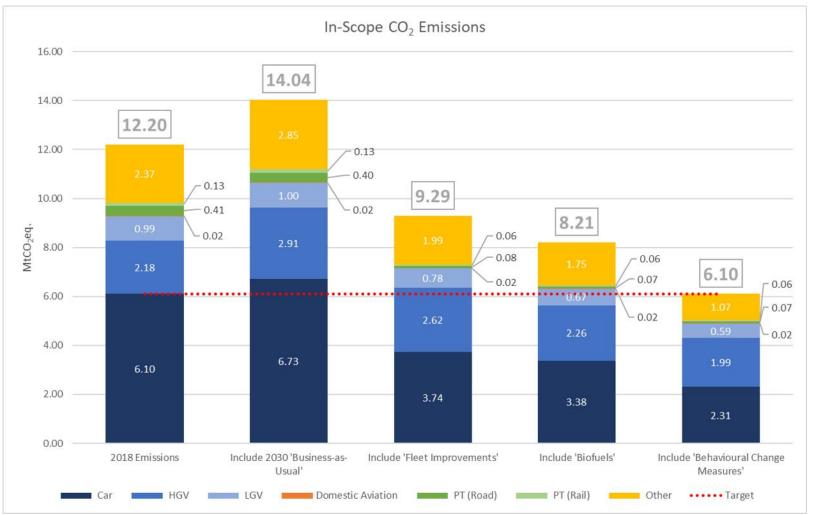

Introduction Questions the RMS can help answer

5

What carbon emissions reductions can be achieved through transport measures?

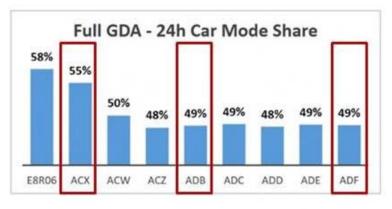

Introduction Questions the RMS can help answer

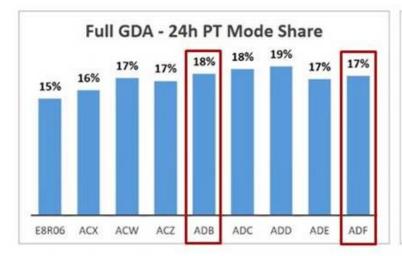

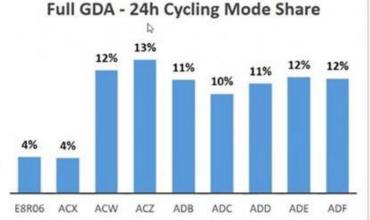

How will the implementation of a strategy influence travel behaviours?

GDA 24h Mode share

Run ID	Name
E8R06	2016 Base
ACX	DoMin D4
ACW	Cycle Prop + No Pking Mgmt + Tolls
ACZ	Strategy Hardcoded BusSpeed
ADB	Strategy
ADC	Strategy 60% Cyc. Prop.
ADD	Strategy + IVT reduction
ADE	Strategy Without Bus Speed hardcoded
ADF	Strategy Without DART UG

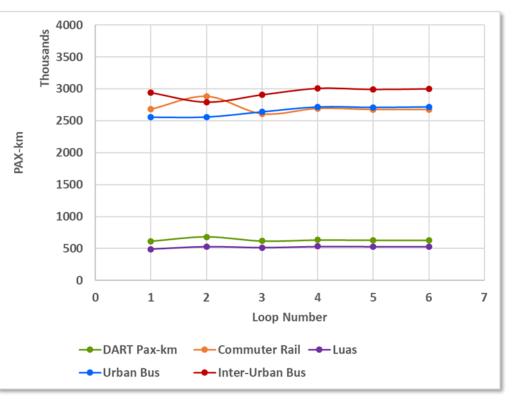

Introduction Questions the RMS can help answer

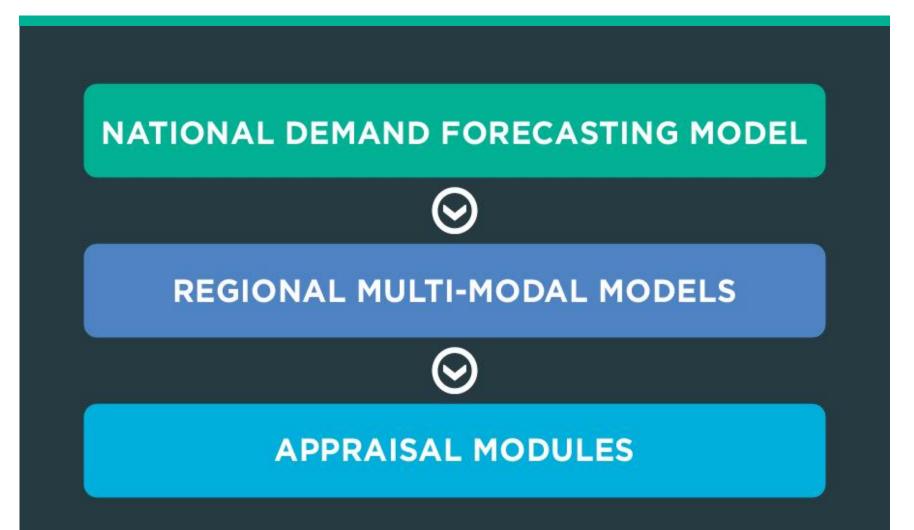

How will reducing public transport fares influence mode shares and distances travelled?

CHANGES	Fares Reduced by 100%	Fares Reduced by 50%					
Passenger Distance (km)	24-Hour Sum	24-Hour Sum					
PT MODES							
DART	129,000 (+22.7%)	48,800 (+8.6%)					
Commuter Rail	736,600 (+31.5%)	291,700 (+12.5%)					
LUAS	120,600 (+26.9%)	62,800 (+14.0%)					
Urban / Town Bus	289,300 (+12.0%)	288,100 (+11.9%)					
Inter-Urban Bus	420,500 (+16.4%)	407,900 (+15.9%)					
Grand Totals	1,696,000 (+20.3%)	1,099,200 (+13.2%)					

Model Overview Regional Modelling System

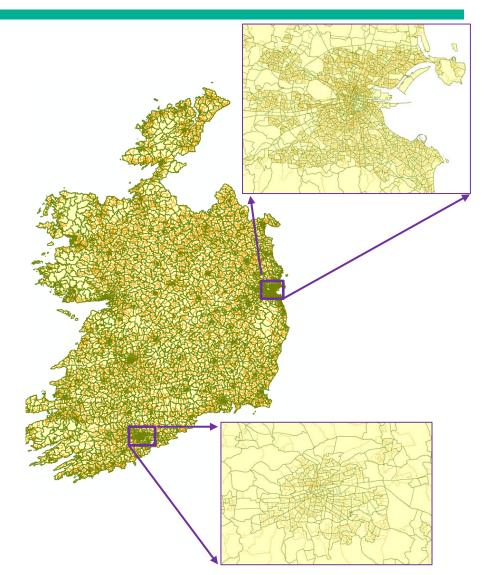

Model Overview NTA Zones and Census Small Areas

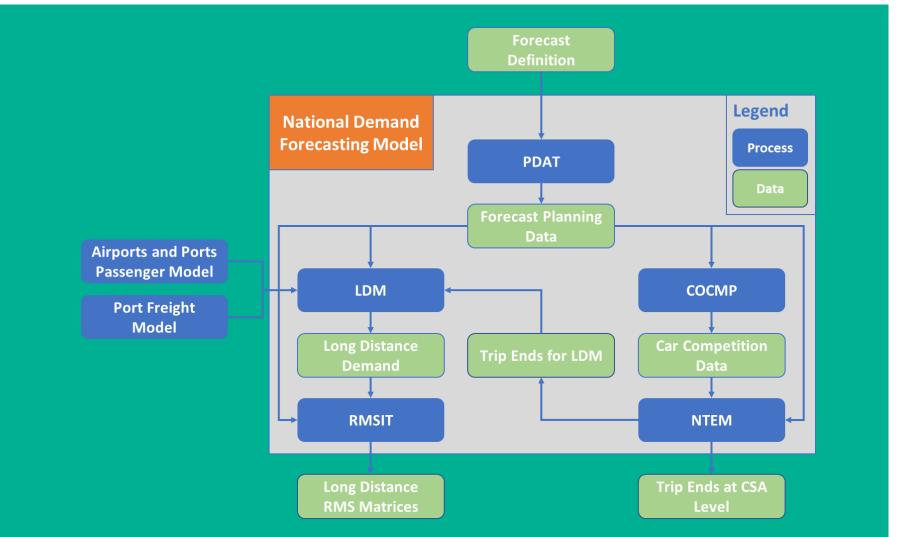

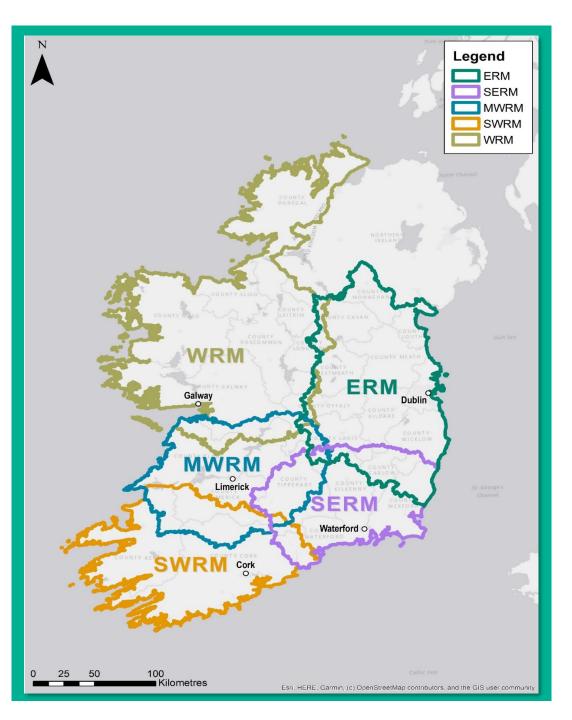

- NTA zonal systems
- Consistent national system used for each Regional Model
- Related to CSA/ED system used but coarser for computational requirements
- 4,770 zones in 2016 model sitting on top of 18,641 Census Small Areas in 2016 census
- Currently updating to 2022 data and PT timetables

Model Overview National Demand Forecasting Model (NDFM)

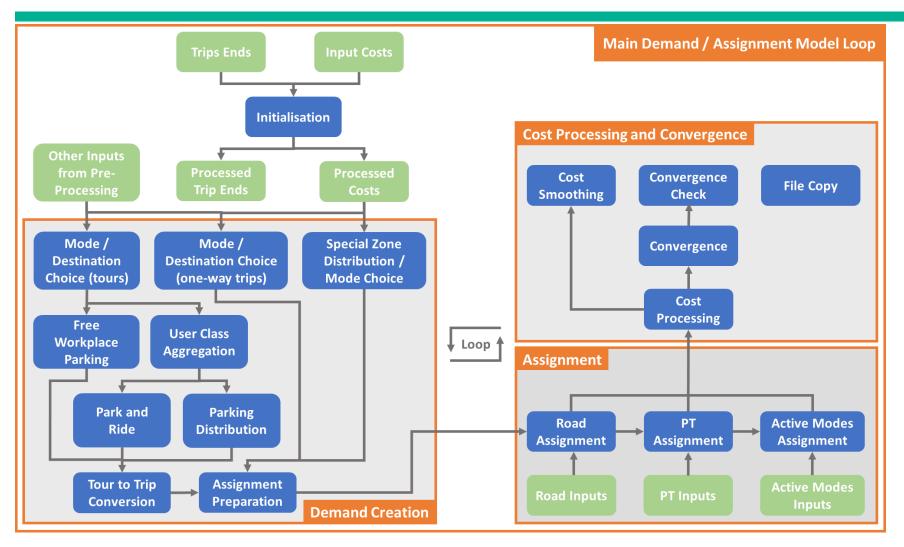

Model Overview Regional Models

- Multi modal assignment: public transport, highway, walking, and cycling
- Mode and destination choice influenced by parking availability and supply (e.g., Park-and-Ride)
- Key outputs: distance travelled, trips, and mode share

Model Overview Regional Model Demand Components

Model Inputs Trip Demand

Inputs

- Planning Sheet for Forecast Year
- Road and PT networks (proposed schemes)
- Forecast Car Ownership
- Proposed policies

Parameters

- Vehicle Operating Costs "PPK"
- Values of Time (VoT)
- GenCost parameters ->
 Responses/sensitivities to changes in GenCost based on 2016 data such as POWSCAR & NHTS

Model Inputs Trip Demand

Model Inputs

& Sten

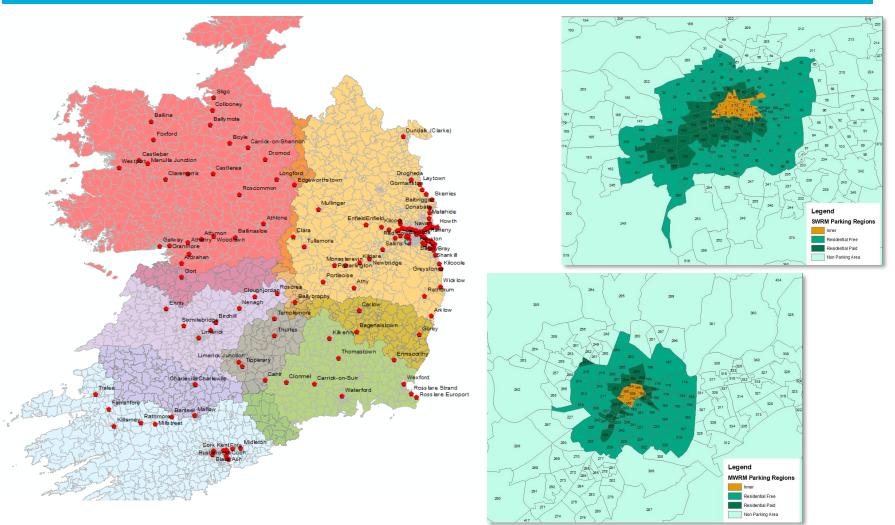

Networks: main roads & tolls, scheduled public transport and cycle networks

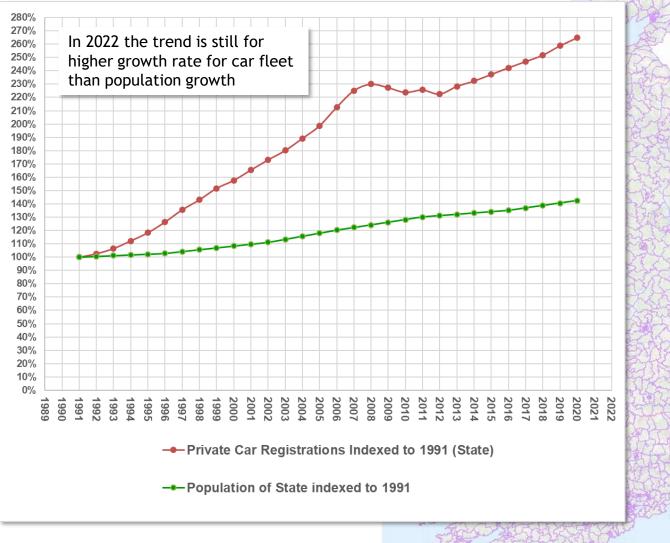

ERM Network Coverage

Model Inputs Parking spaces and charges

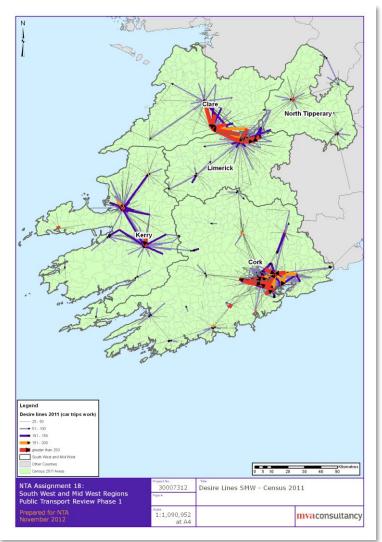

Model Inputs National Car Ownership Trend

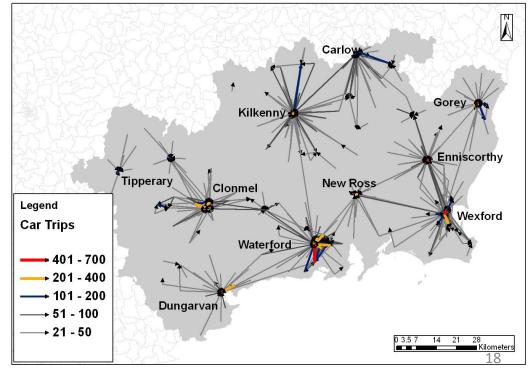

Model Inputs Existing Patterns of Car Travel

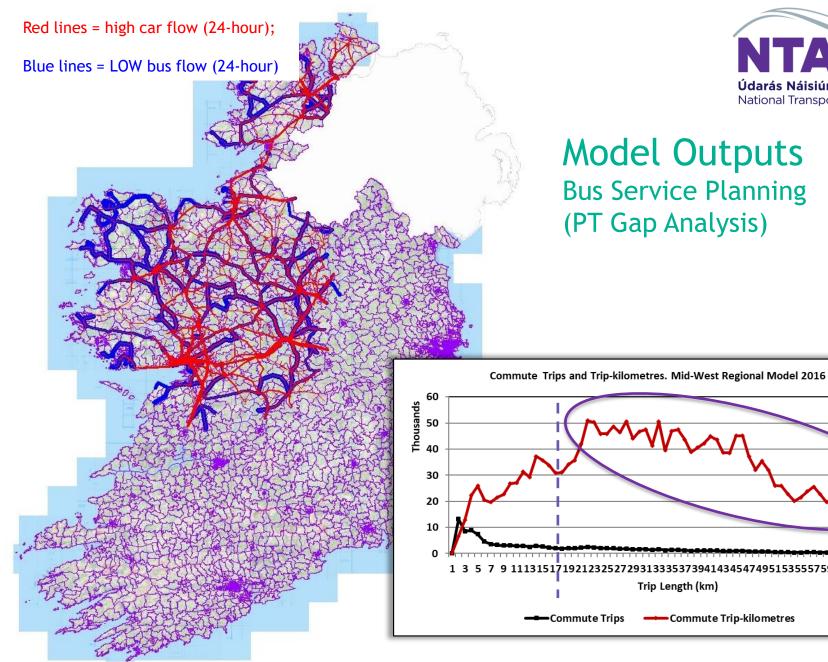

Facilitated by better roads and lower housing costs in more remote locations.

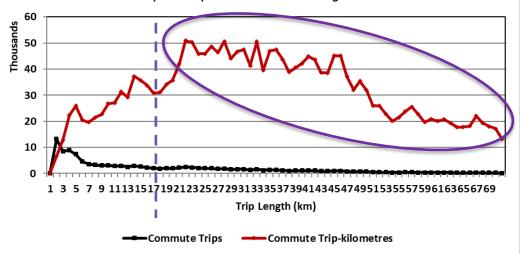

As specified in the planning sheet / POWSCAR data + NPF forecast

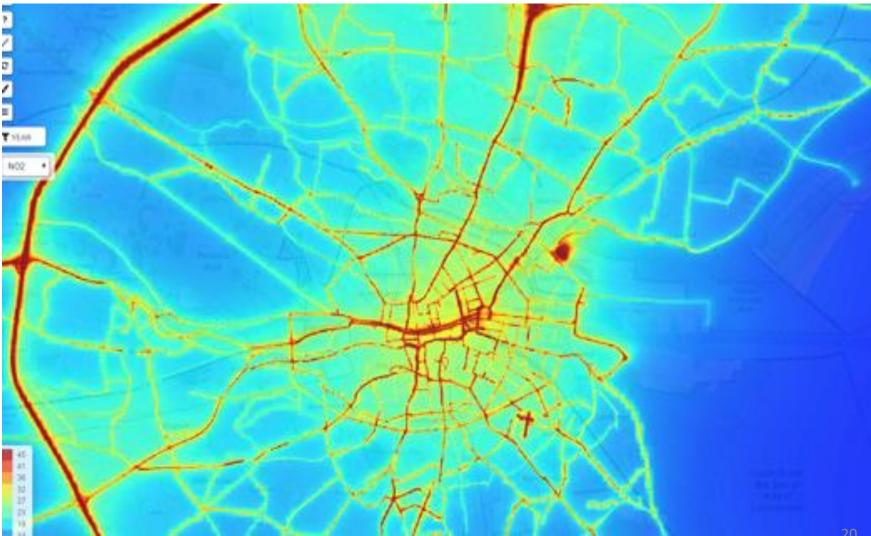

Model Outputs **Bus Service Planning** (PT Gap Analysis)

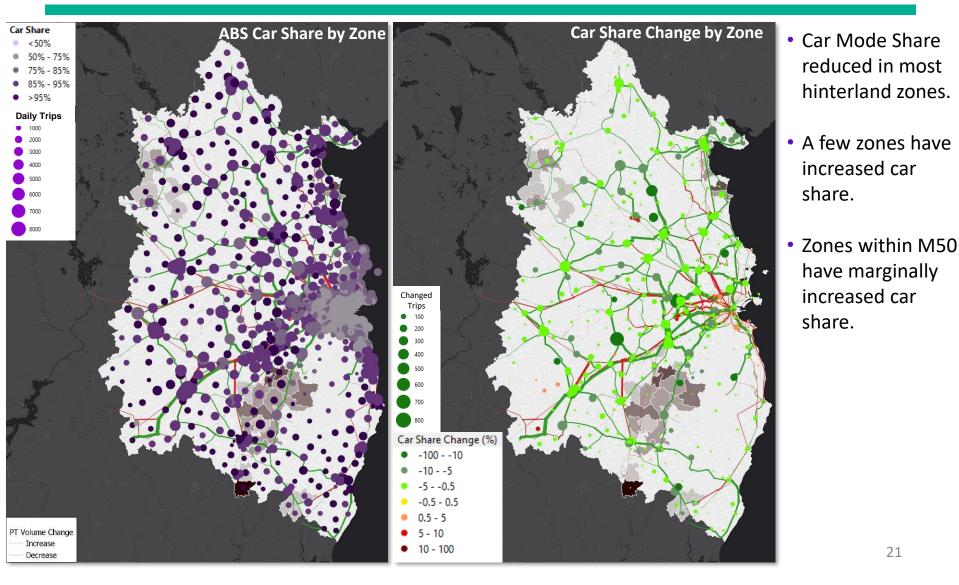

Model Outputs GHG/particulate emissions sources/Noise mapping

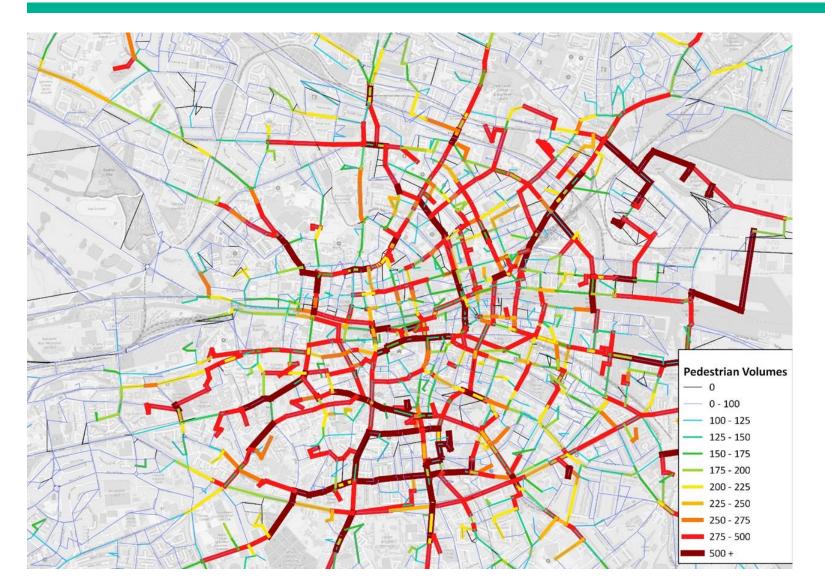

Model Outputs 2042 GDA Strategy modelling

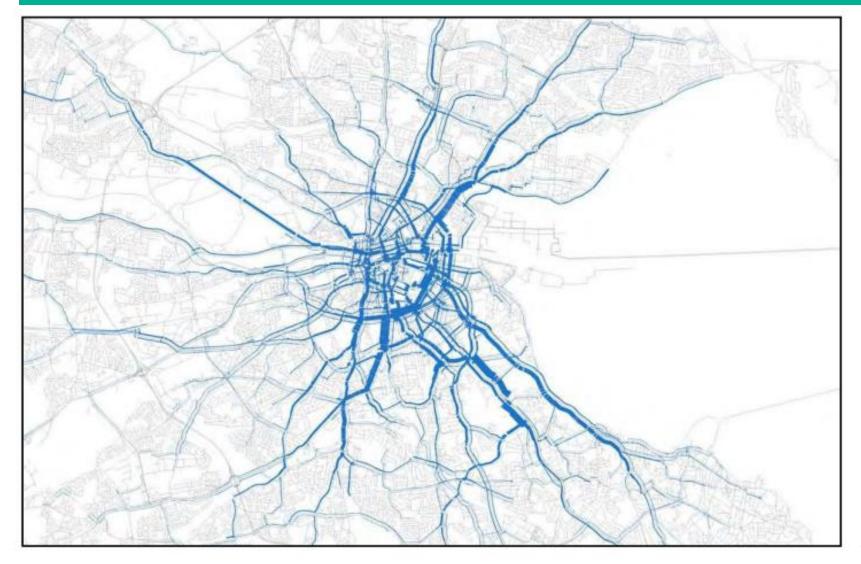

Model Outputs Assignments: Walking

Model Outputs Assignments: Cycling

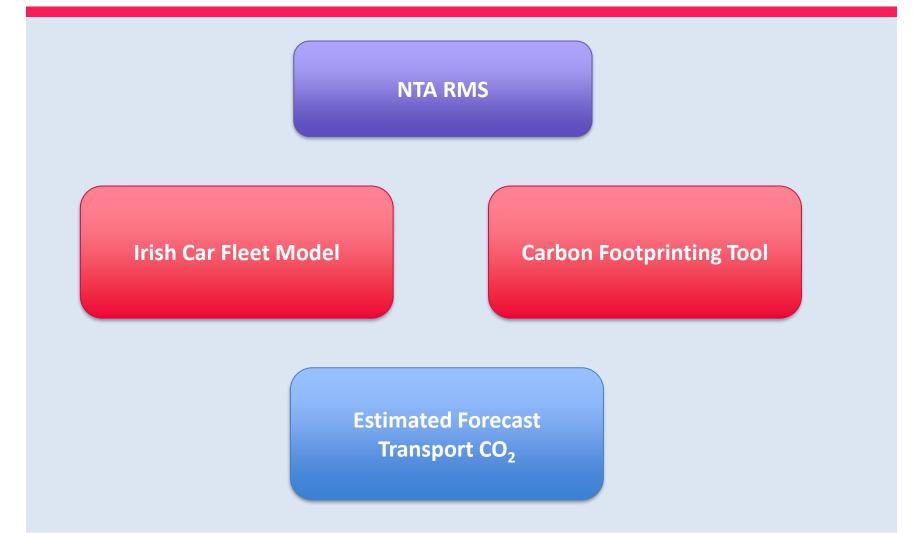

Climate Action Plan Modelling Approach

CAP Emissions Modelling

Tools and Output

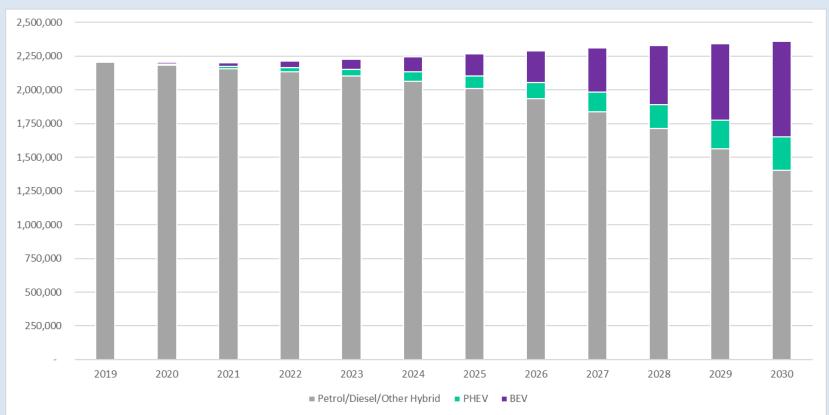

CAP Emissions Modelling

Irish Car Fleet Model

Projections: Car Fleet Mix On the Road

Note: NTA predictions are based on CAP23 inputs (dated 24 May 2022). It is estimated that there will be a 6% increase in total cars on the road. **By 2030, 11% of cars on the road will be PHEV and 30% of cars on the road will be BEV.**

CAP Emissions Modelling

Carbon Footprinting Tool (CFT)

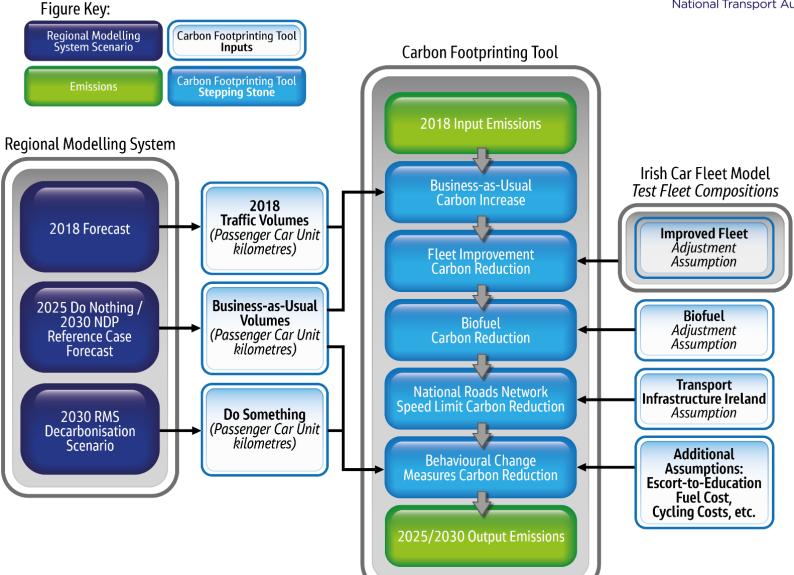

Description

- The CFT estimates the percentage reduction in carbon emissions from each transport-related measure and applies these sequentially to the 2025 and 2030 'Business-as-Usual' carbon emissions forecasts.
- The outputs from the CFT are compared to the 2018 baseline level of emissions to determine how well each package of measures performs against the emissions reduction target.

Summary Transport and Emissions Modelling Services

Transport Modelling Services National Climate Modelling Assets -Links to Key Gov / Agency Outputs

Forestry models

Monitoring and projecting climate change measures for Irish forestry

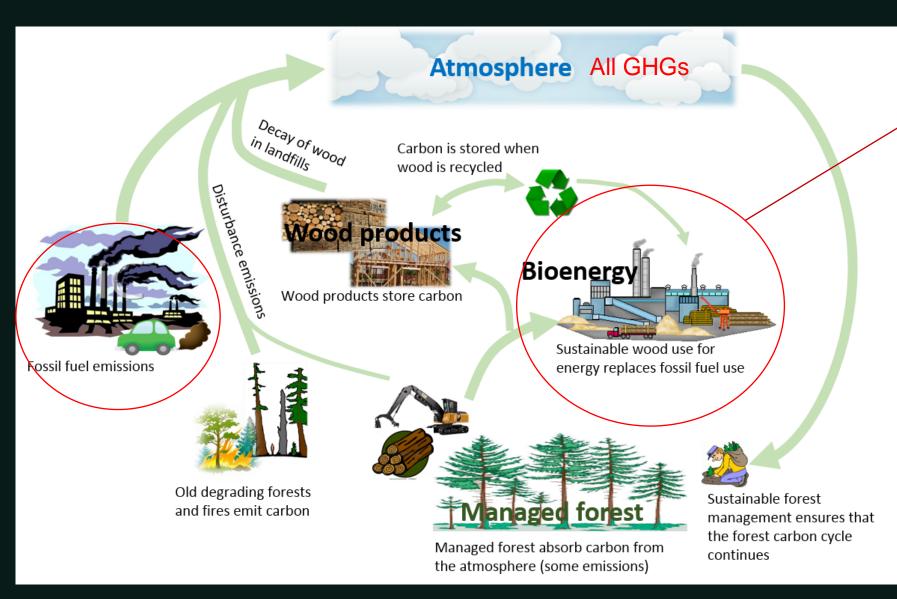

Outline

- Current uses
- Basic concepts
- What is the model requirement?
- Brief model overview
- Calibration and inputs
- Drivers and trends
- Sensitivities

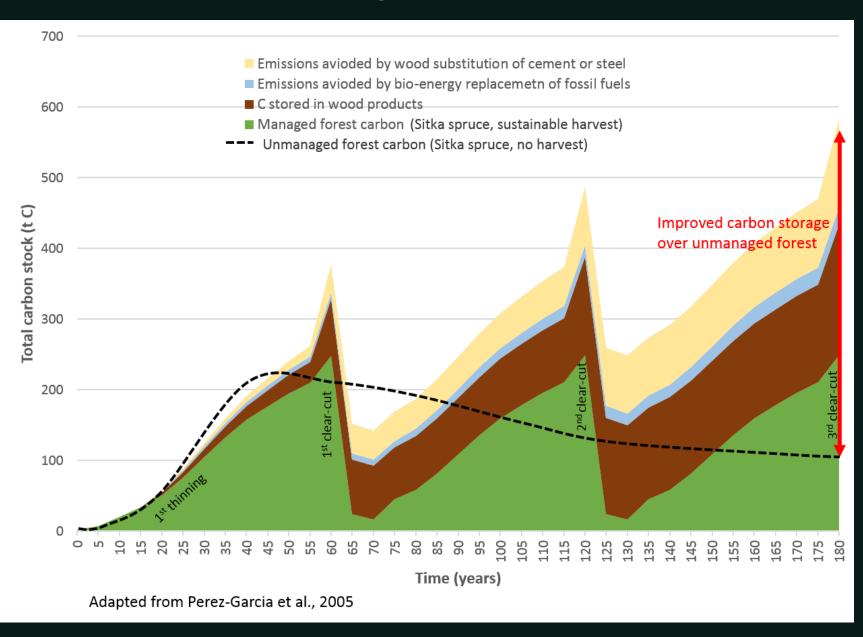

Concepts-system boundary

Outside boundary

- Product and energy substitution
- Grazing shift leakage
 - Livestock numbers?
- Mill sector emissions
- Economic impact on harvest and silviculture
- Land price, farm payments

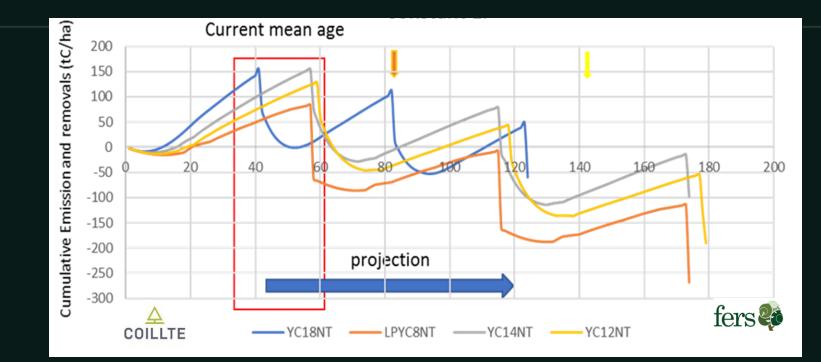

Stand cycle

- Afforestation results in a slow but saturated sink
- Sustainable management should conserve or enhance the forest sinks
- Product use patways

- Forest are not always sinks
- Over-harvest
- Short rotations
- Age class shifts
- Organic soils
- Natural disturbances

Organic soils

- Most forests are on organic soils (most established before 2000)- highest proportion in EU
- New emission factor 1.68tC/ha/yr~6.2tCO₂ (not in 2018 target)
- Afforestation initially a sink but transitions to net emission after 1-3 rotations (Black et al., 2023, Hargraves et al 2003)

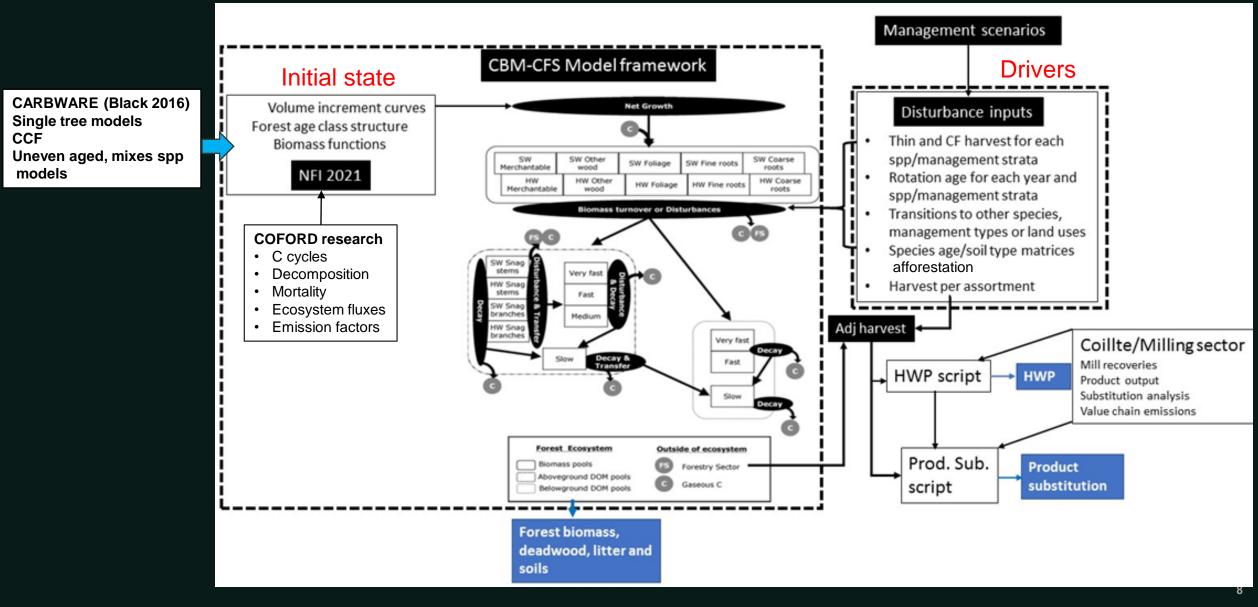

Forest model requirements

- Forestry is a long term business
 - Impacts are long term and dynamically alter as management changes
 - Baseline is not static (measures assessed relative to a baseline (BAU))
- Model net ecosystem exchange- gains (growth) losses (disturbances, mortality, extreme events)
- A complete carbon cycle in forest and HWP pools
- Must reflect silviculture, species productivity, age class structure
- Manipulation of drivers for scenario analysis
- Must align with GHG inventories and resemble something close to reality (validation)
- Range of models CBM, CARBWARE, G4M, EFISCEN
 - Different scales (stand to landscape, regional to global)
 - System boundaries (all pools, some pools, dynamic static)

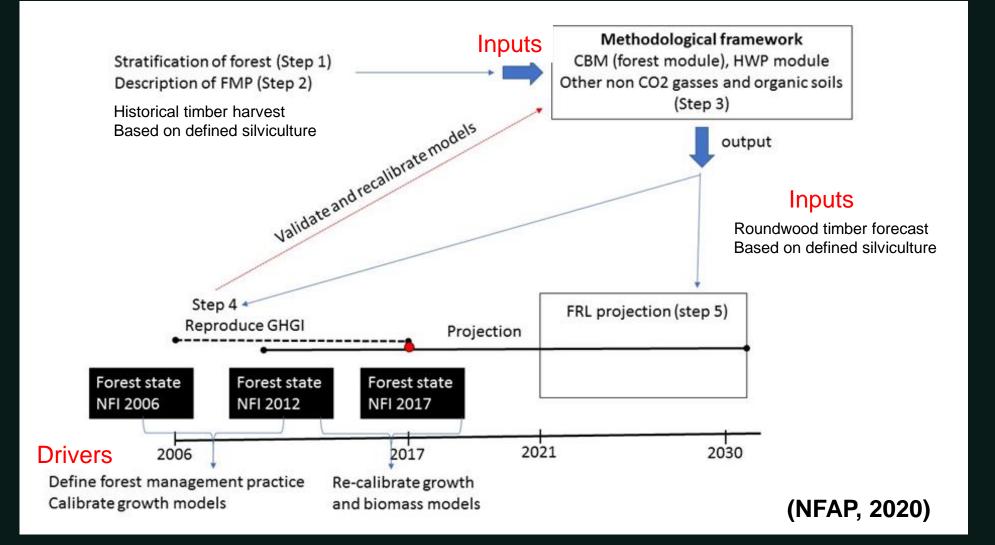

CBM-CFS

- Software framework that uses local models
- Developed in Canada for carbon accounting under UNFCCC and IPCC guidelines (regional and landscape scale)
- Calibrated for Irish conditions using the National forest inventory (NFI) and over 20 years of COFORD research
- Used in the GHG inventory, for Ireland, Czechia, Poland, Canada, EU JRC
- Used for the KP 2013-2020 FM projections and EU LULUCF regulation (NFAP, 2019), Coillte strategy 2023, Teagasc MACC, 2023
- Validated using NFI, research data

CBM-CFS-overview

Calibration of models for GHG projections

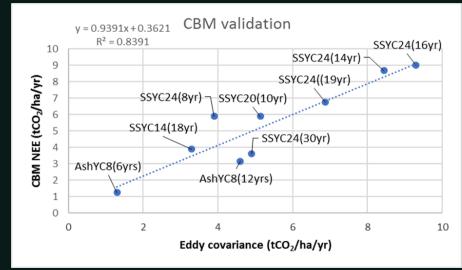

Validation of CBM

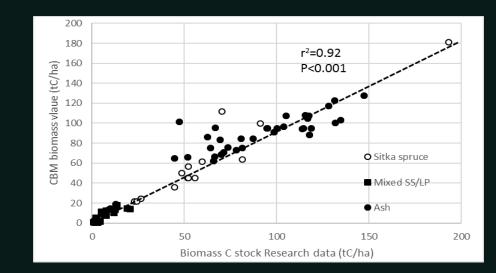

NFI 2006-2021

Biomass C stocks (MtC)							
			Confidence interval				
			(95%)				
Year	CBM	NFI	Lower	upper			
2006	38.9	37.3	35.8	38.8			
2012	47.2	48.5	46.5	50.5			
2017	54.3	55.9	53.8	57.9			
2021	59.4	63.2	59.3	65.6			

Currently recalibrating using the 2021 NFI

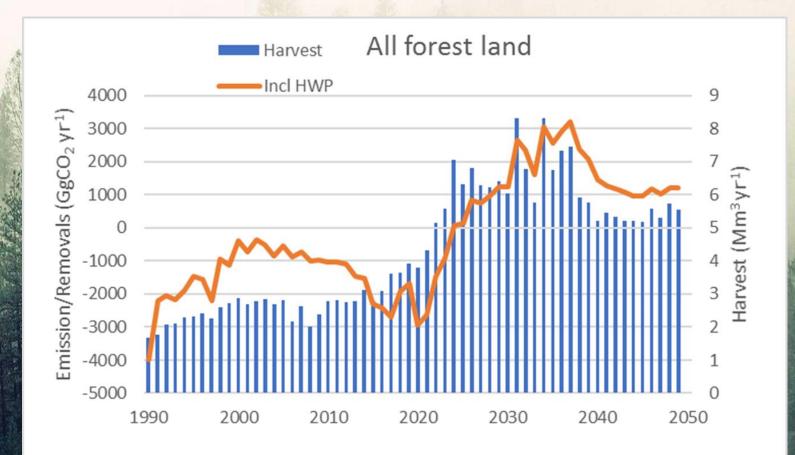

Research stands

2021 GHGi

- AR (299kha):- 2.8MtCO₂e
- FM (481 kha): 1.6MtCO₂e
- HWP: -0.9MtCO₂e

Including Climate change action plan afforestation targets (8000 ha per year)

Trends Large legacy impact: Future trends pre-determined 20-30years ago

Drivers

AFFORESTATION

- Reduction in afforestation from 25,000 in 1990s to 2,000 ha .
- Afforestation of organic soils.

DEFORESATATION

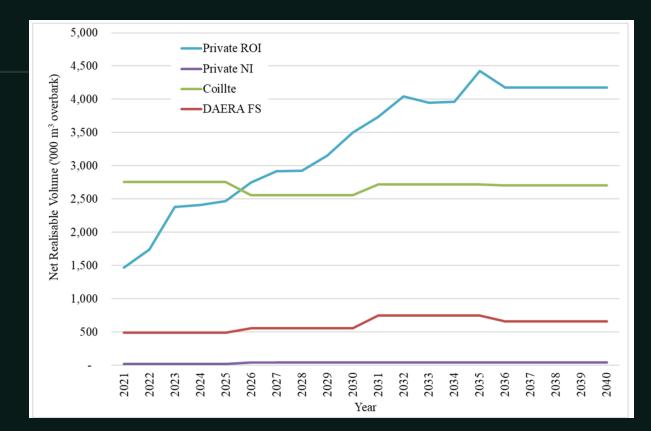

• 725 ha per year

FOREST MANAGEMENT

- Continued emissions from organic soils
- Increase in historical harvest from 1 to 4 Mm³ per year.
- Shorter rotation ages
- 5-fold increase in harvest to 2040
- Age class legacy effects.

Harvest Roundwood forecast 2021-2040

- **Based on current silviculture and age class** • structure
- Previous forecasts accurate, verified by NFI ullet
- Used in Kyoto protocol, NFAP (EU LULUCF • reg) projections

13

Age class legacy

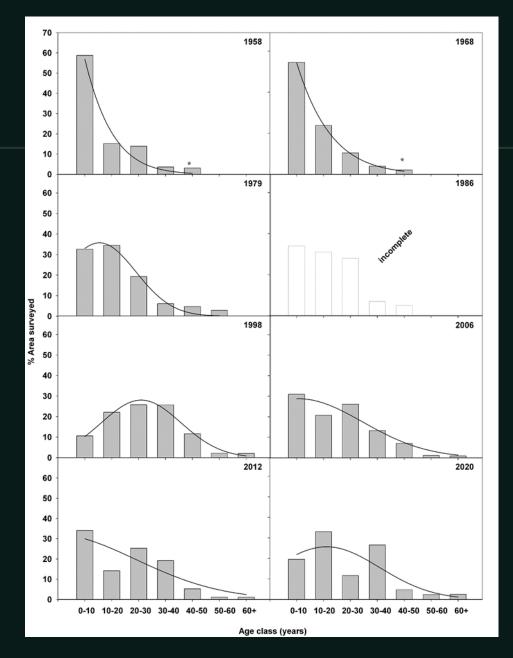

Forest growth and C capture declines after clearfell

High disturbance losses after replanting

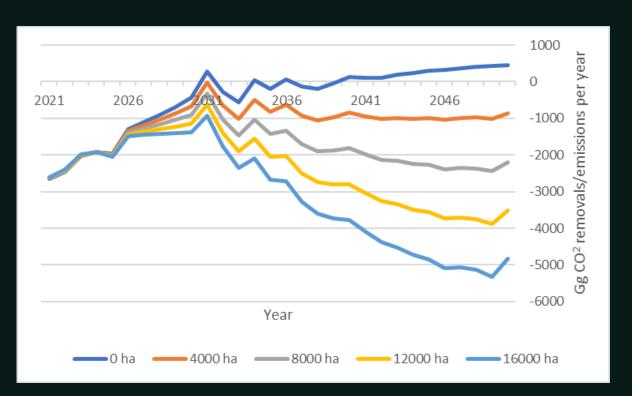

All conifer forests afforested over period 1990 to 2020 due to be harvested in the next 20years (over 330,000 ha half the estate)

Typical for developing forestry sectors and results in natural fluctuations from sink to source

The bases for the forward looking base line (net-net accounting e.g. KP 2013-2020 EU LULUCF reg 2021-2025)

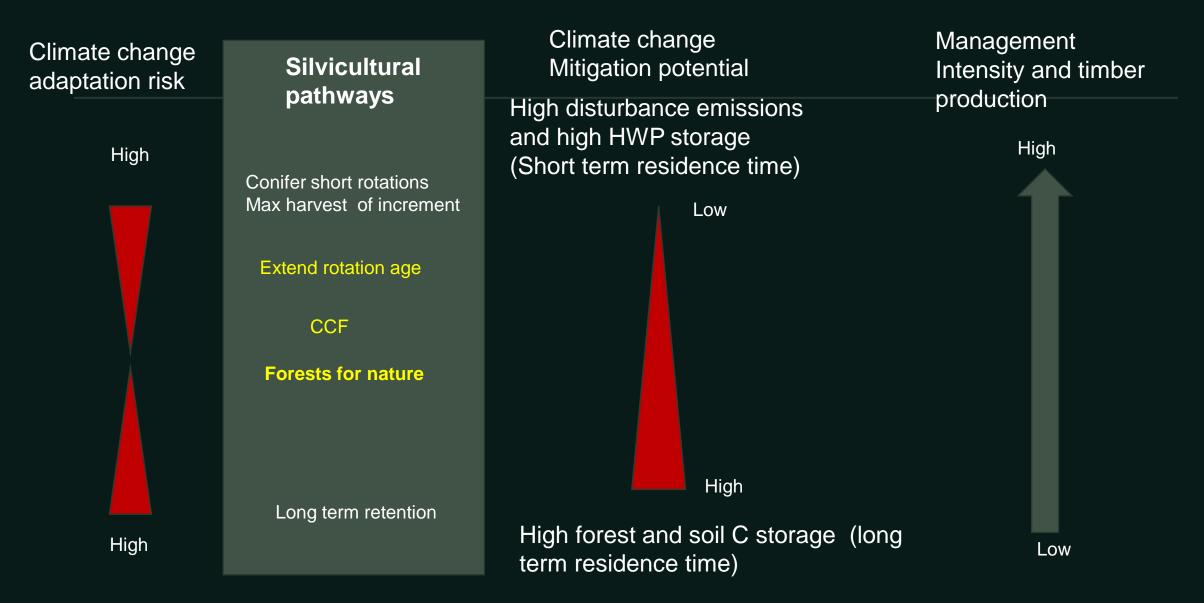

Model-Sensitivity

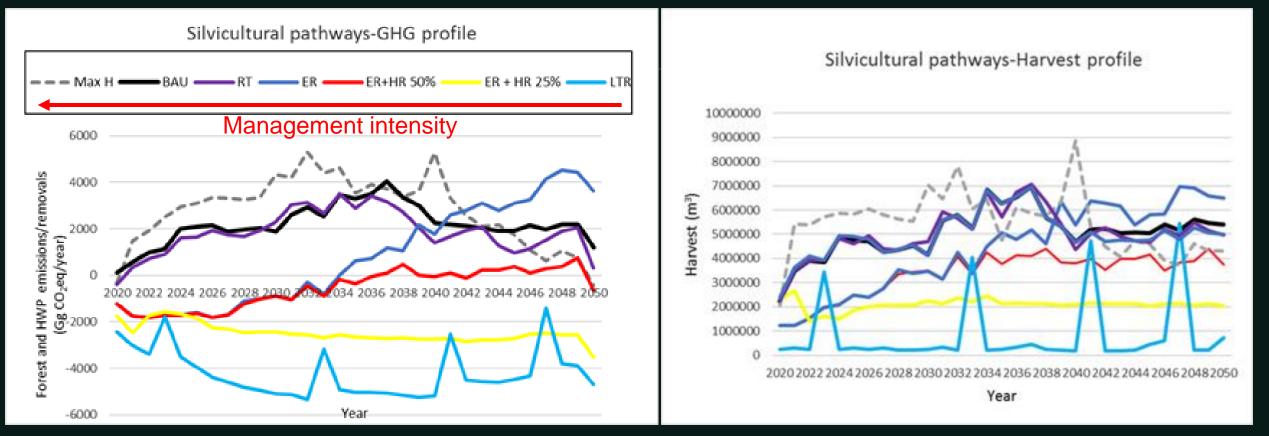

- Existing afforestation 1.4MtCO₂ emission from 2031-2050 or 0.5MtCO₂ by 2050
- Additional afforestation has a small short term but large long term impact
- Impact is dependent on:
 - Rate of afforestation
 - Species
 - Soils
 - Management options
 - Legacy afforestation rates and soils

Sensitivity- Modelled Forest management strategies

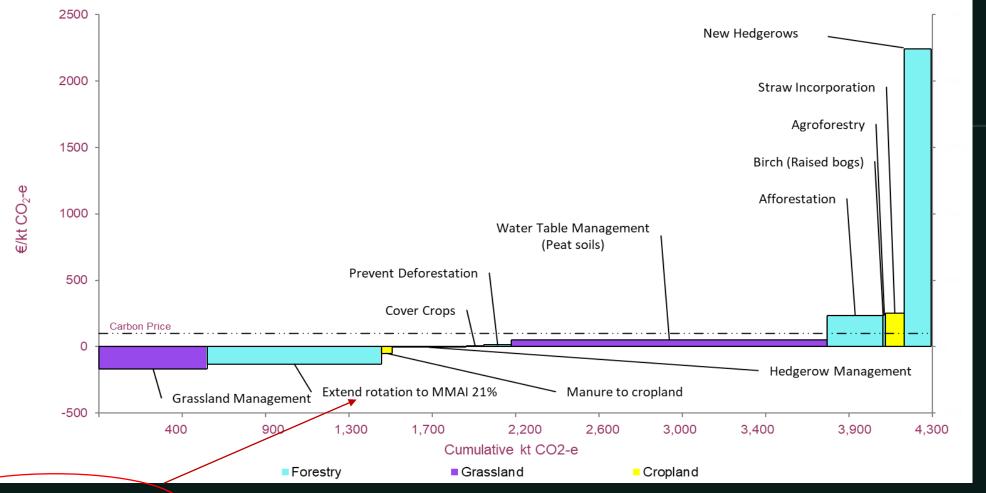

Sensitivity FOREST MANAGEMENT and NATURAL DISTUBANCES

- Max H- maximum harvest
- BAU- current silviculture
- RT- reduce thinnings (more no thin strategies)
- ER- extend rotation age
- HR- constrain harvest to 50 and 25% of increment
- LRT- long term retention (no harvest- high natural disturbance risk)

MACC-measures

Positive abatement

- Extend rotation age or conversion to CCF
- Conversion to native woodland (raised bogs)
- Avoid deforestation
- Afforestation/Agroforestry

Negative abatement

- Water framework (reduced productive area))
- Rewetting of peatland forests
- Habitat constraints (Hen harrier)

Summary

- CBM fully compatible with GHGi
- Simulates all drivers in a dynamic manner
 - No global or local economic drivers
- Fully validated, provides confidence
- Afforestation, forest management and avoidance of deforestation can be considered
 - Afforestation options
 - Long and short term measures
 - Alternative management pathways
- Peatland forests?
 - Rewetting (net emission)?
 - Alternative management strategy (Coillte 2023)
